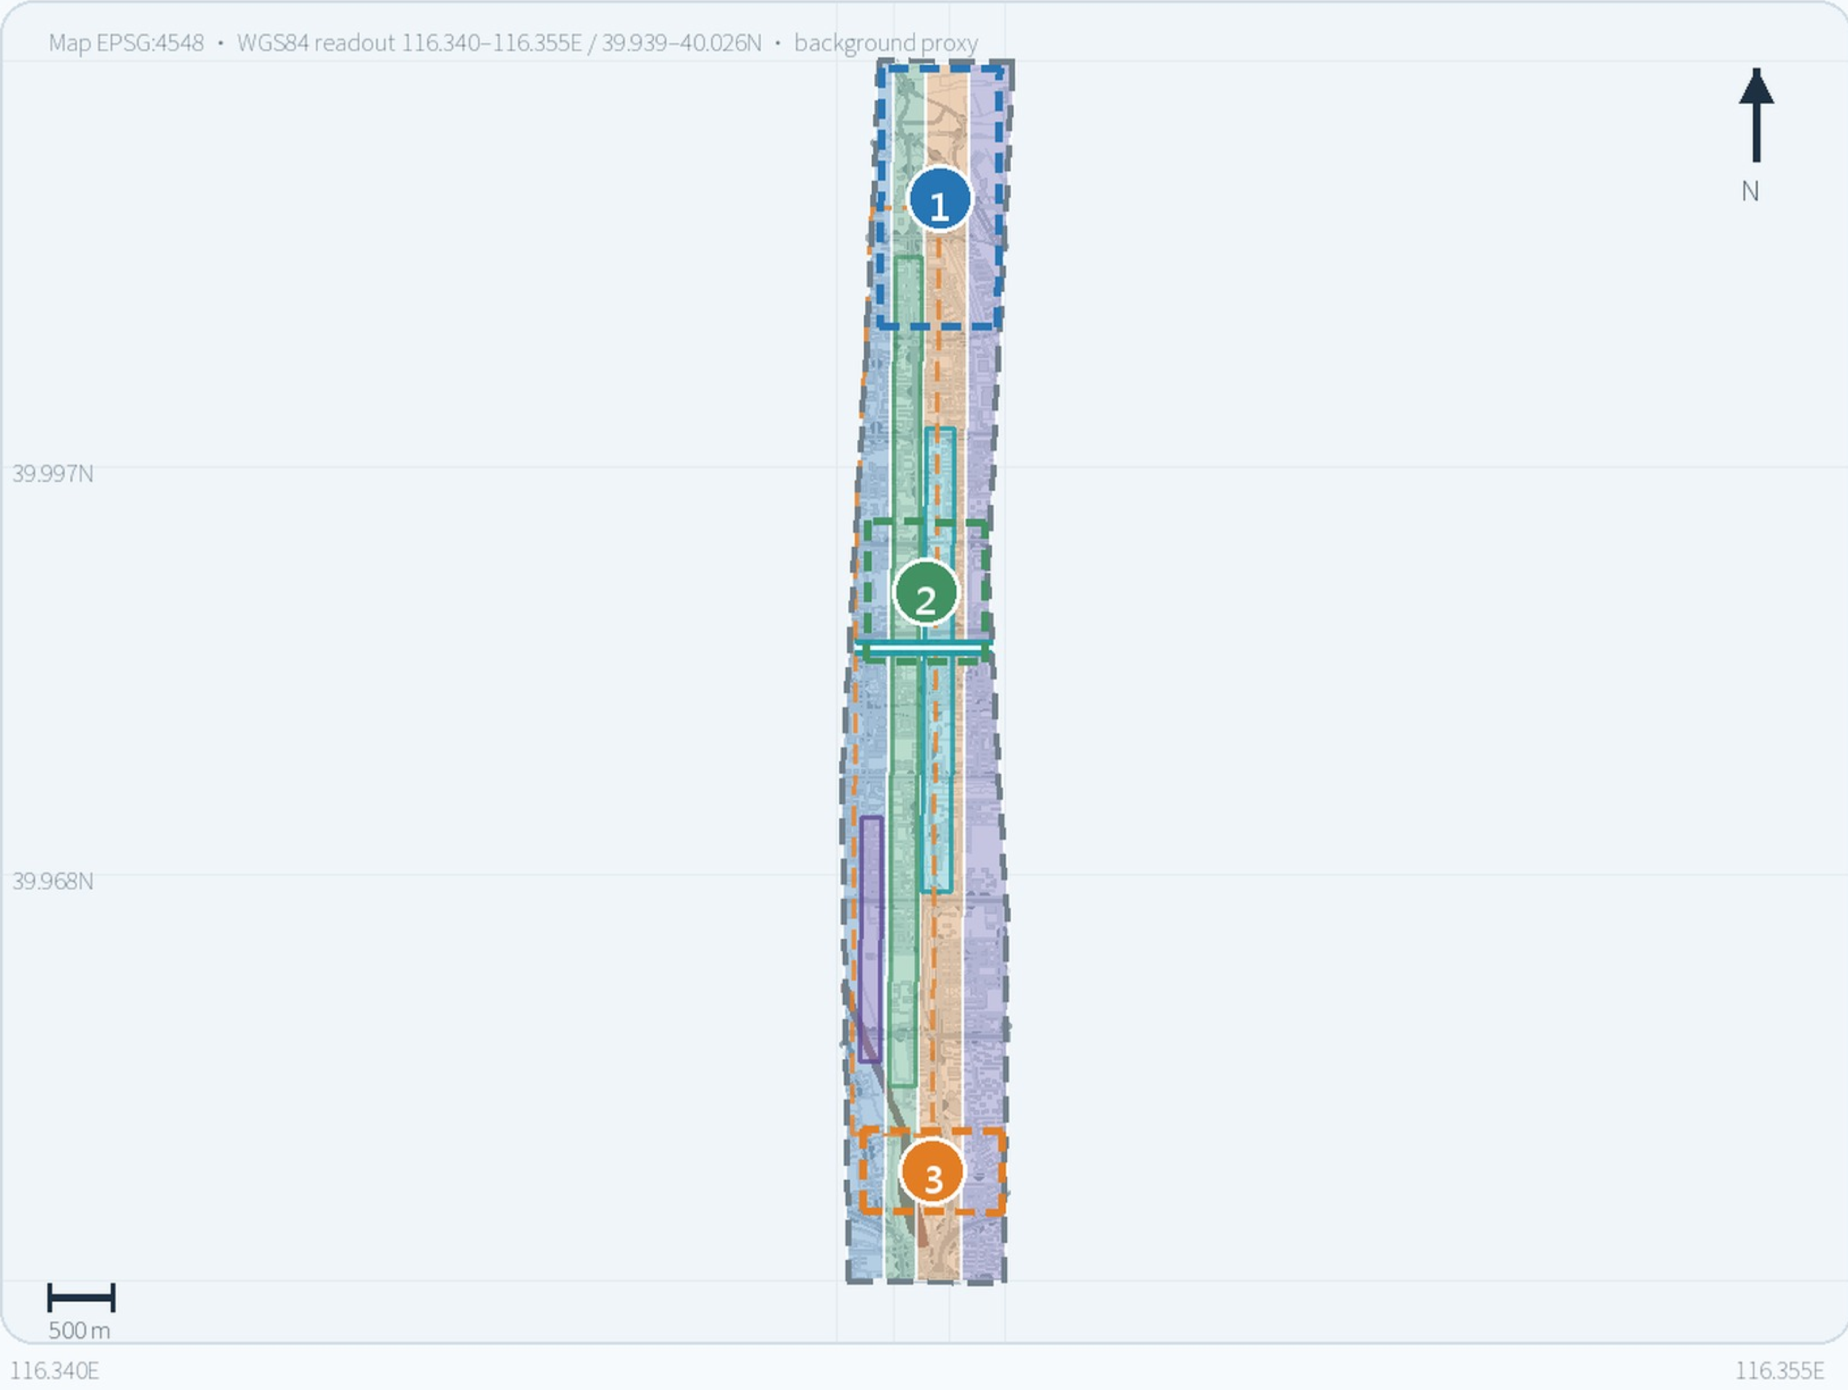
One provisional boundary and one metric basis; background proxies support orientation but never replace statutory evidence.

JING-ZHANG AI / PEOPLE-CITY

01 / SITE FRAME

Jing-Zhang AI: A New Chapter for People, City, and Shared Endeavor

A civic spine linking railway memory, open innovation, and everyday public life



Three spatial stories

1 01 Railway heritage
Use the provisional study frame and slow-mobility spine to make the time layer legible.

2 02 Open innovation
Place release, testing, learning, and daily services on accessible public edges.

3 03 Public life
Apply the three people-first tests before an AI scenario goes public; keep it reversible.

Legend and status

- OSM buildings / roads / rail context
- Four design land-use bands (figure 02)
- Key areas 1 / 2 / 3
- Conceptual civic spine
- Provisional boundary

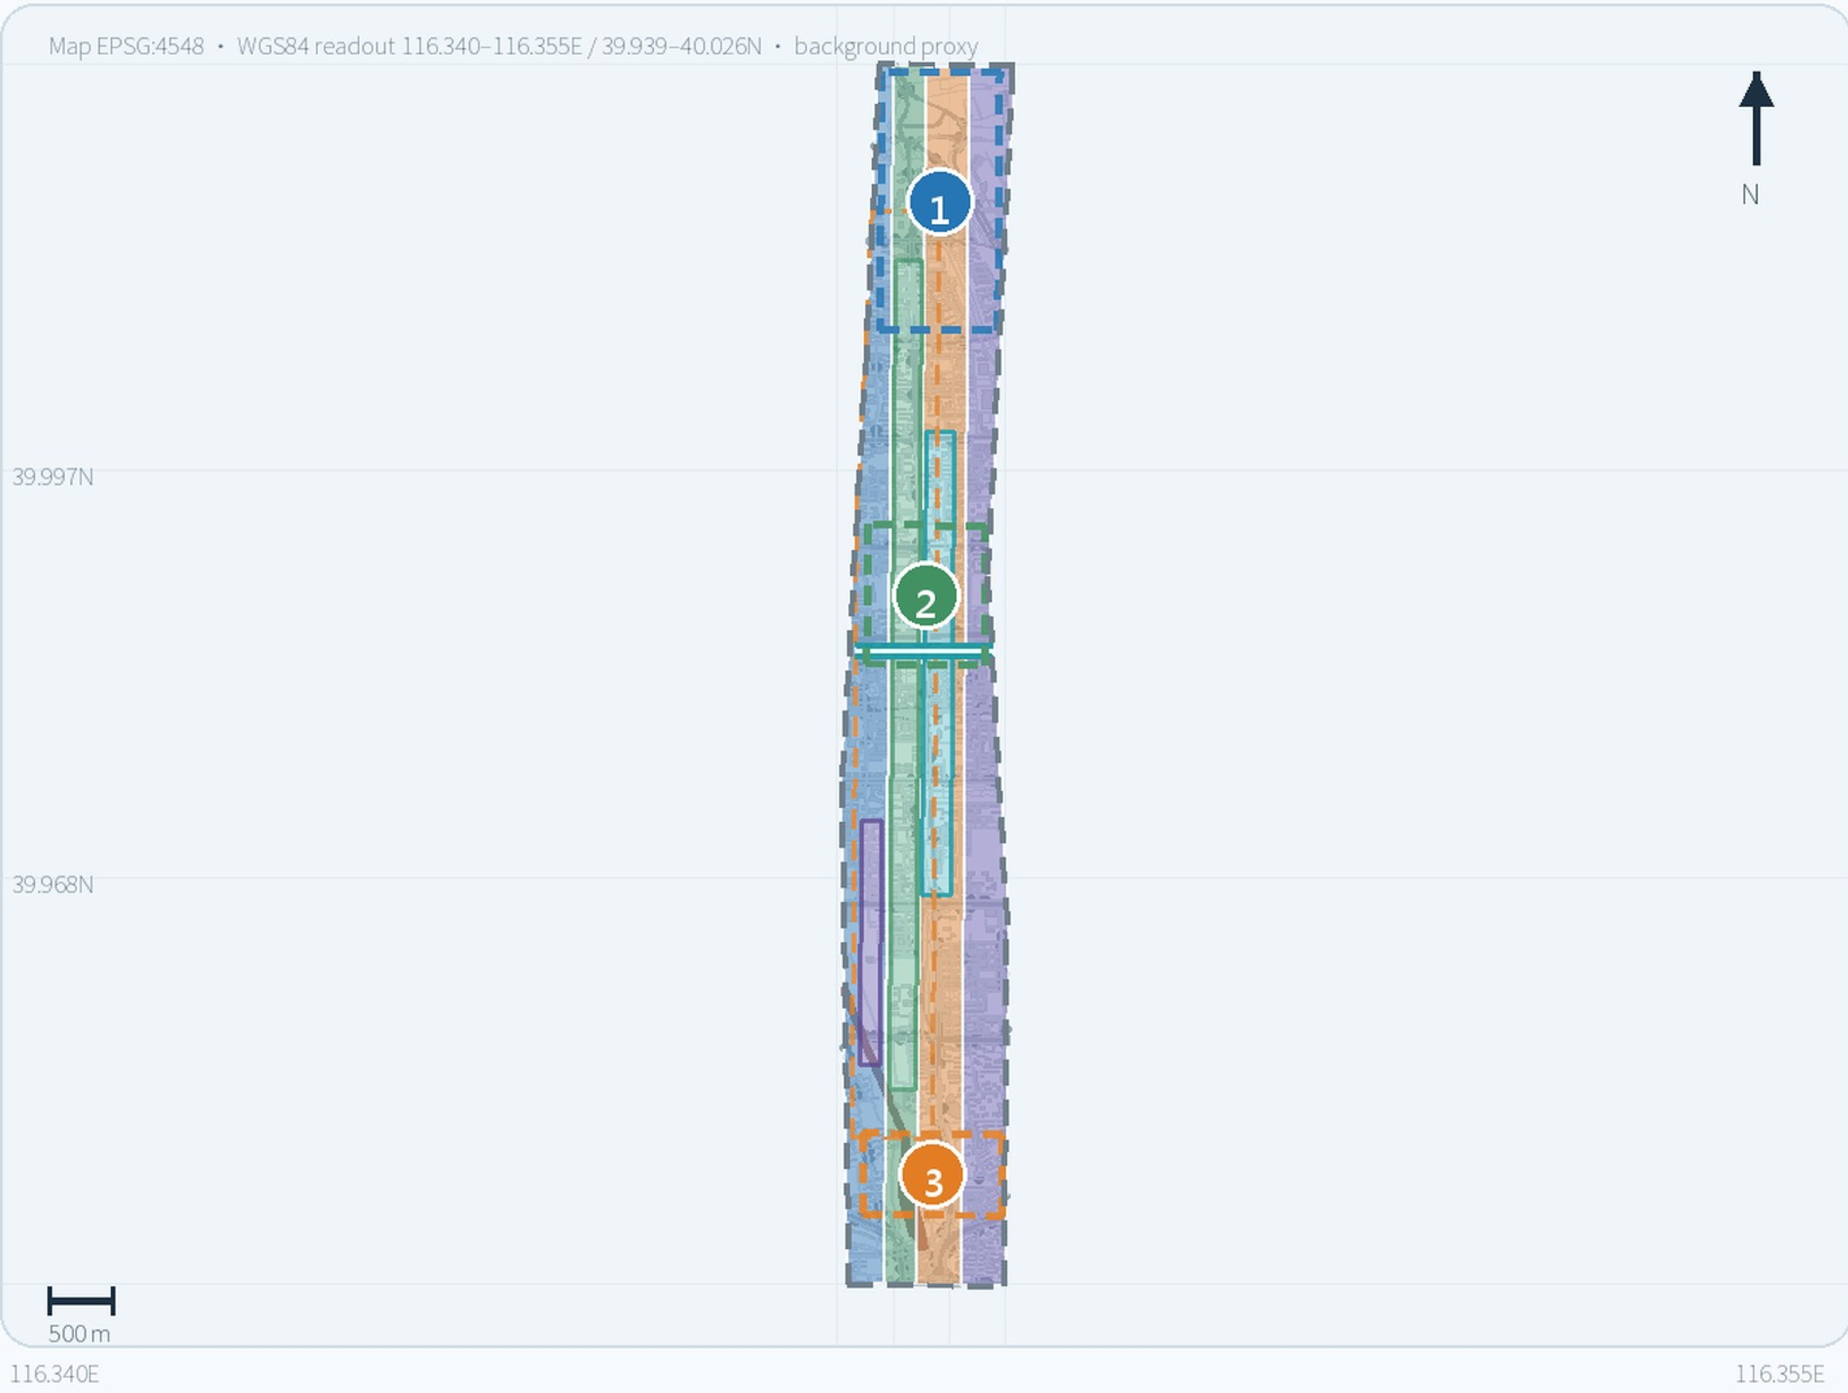
Background: OpenStreetMap contributors / ODbL; provisional boundaries and design layers are not official redlines. Figures are explanatory; GeoJSON, metrics, and source records remain authoritative.

JING-ZHANG AI / PEOPLE-CITY

02 / LAND USE

Three-level land structure: mixed use as a walkable public edge

Design zoning is a proposal layer, not statutory land-use control; context is for orientation



Four design land-use bands

AI research and innovation
23.4% design share

Park green and open space
22.7% design share

Industry and commercial services
29.5% design share

Community services
24.4% design share

Three design rules

Mixed primary uses • short and optional paths • active edges and incremental change

Legend and status

- OSM buildings / roads / rail context
- AI research and innovation
- Park green and open space
- Industry and commercial services
- Community services
- Provisional boundary

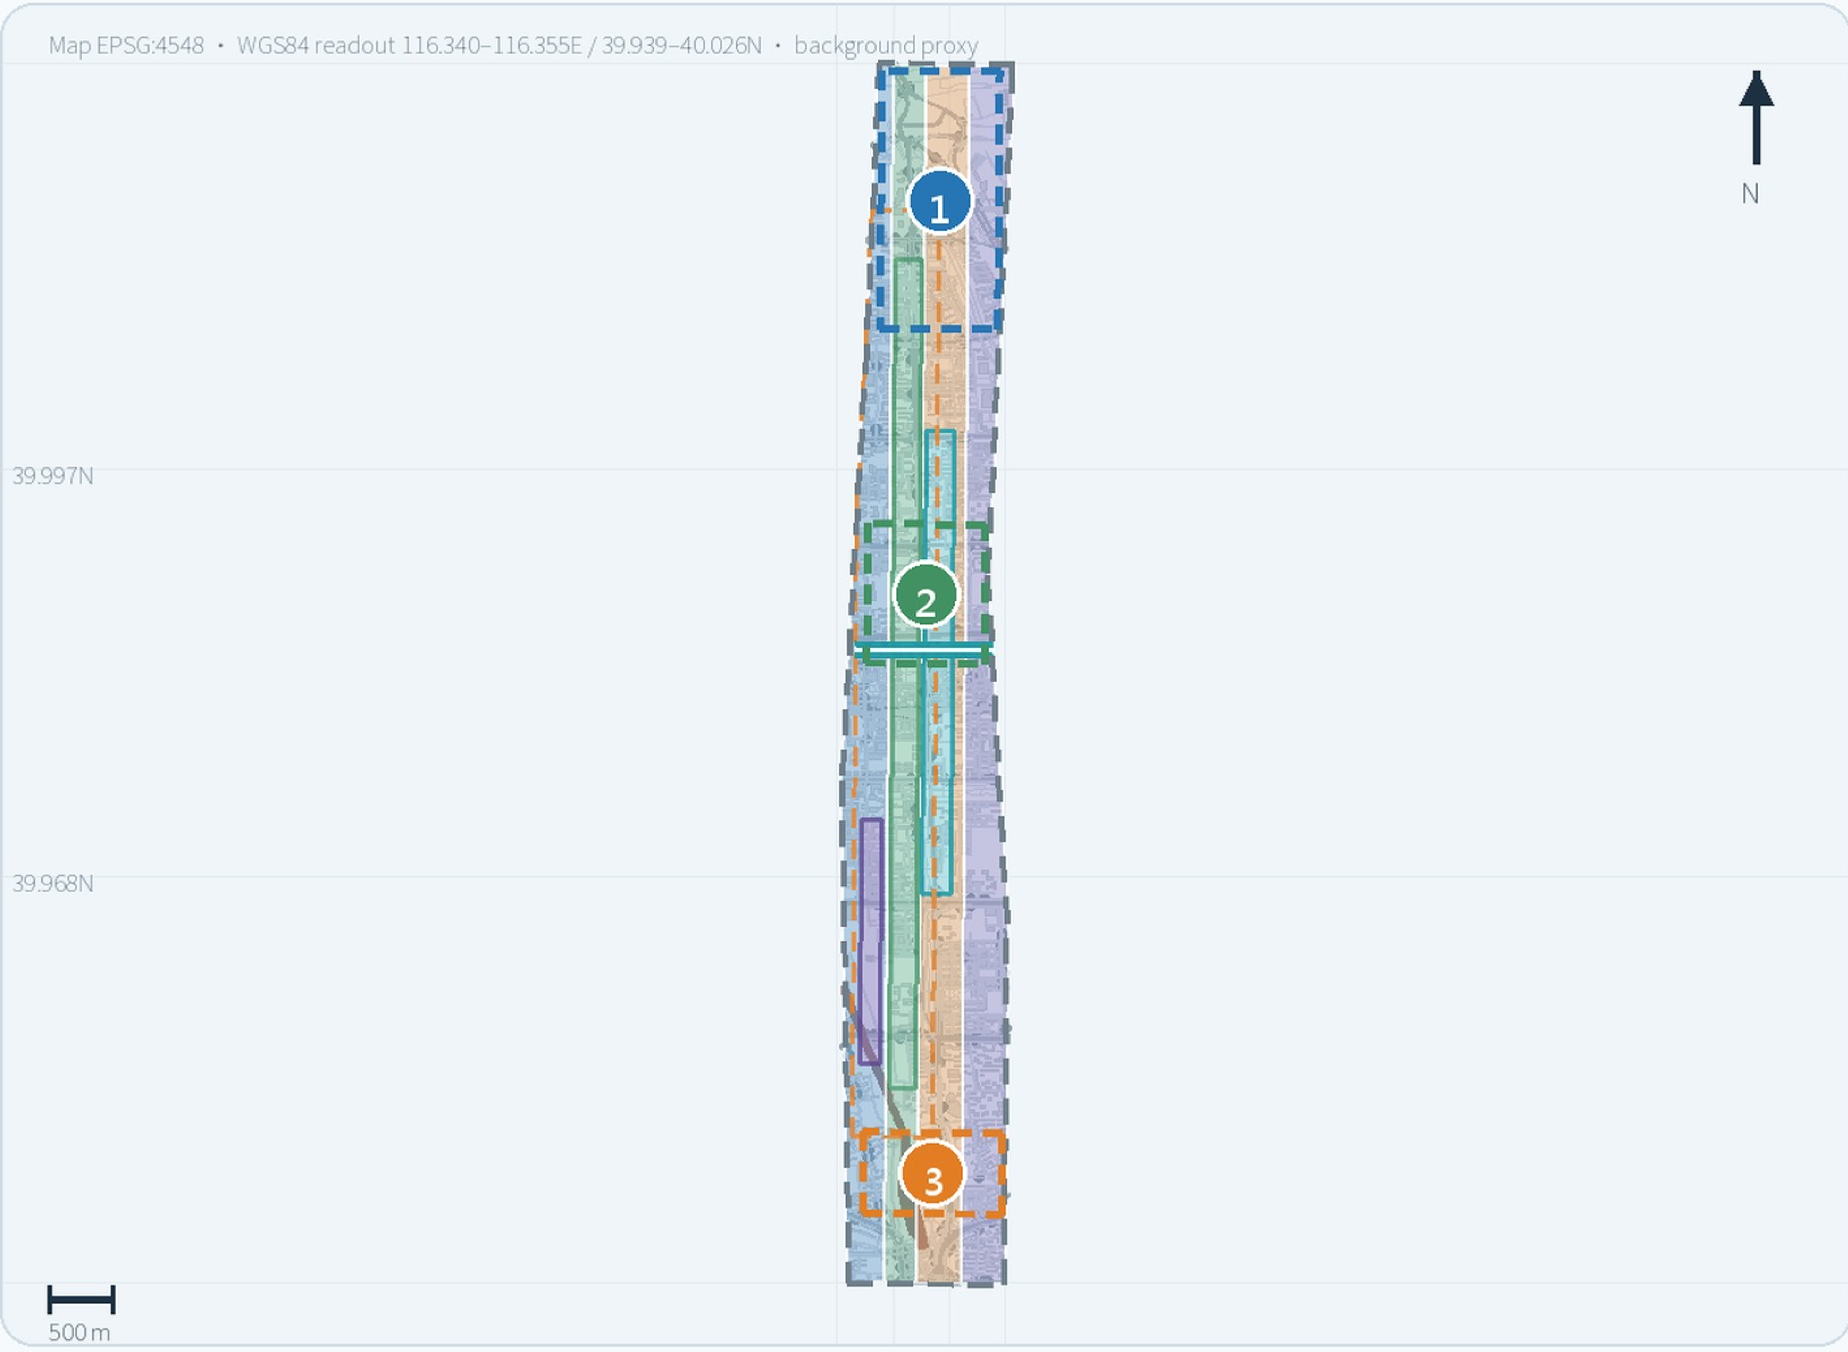
Background: OpenStreetMap contributors / ODbL; provisional boundaries and design layers are not official redlines. Figures are explanatory; GeoJSON, metrics, and source records remain authoritative.

Every spatial move must connect to a verifiable network, an evidence request, and a reversible delivery condition.

JING-ZHANG AI / PEOPLE-CITY | 03 / KEY AREAS

Three key areas: three testbeds for verifiable innovation

Boundaries are provisional rough areas; numbers and strategies are conceptual proposals



116.340E 116.355E

Key-area strategy cards

1 Zhongzhiyuan AI acceleration
1.93 km² provisional calculation · Research + release + daily services

2 Beijing AI Origin Community
1.04 km² provisional calculation · Campus–neighbourhood–park fine-grain links

3 Dazhongsi AI industry cluster
0.72 km² provisional calculation · Station mix, evening civic life, international exchange

Legend and status

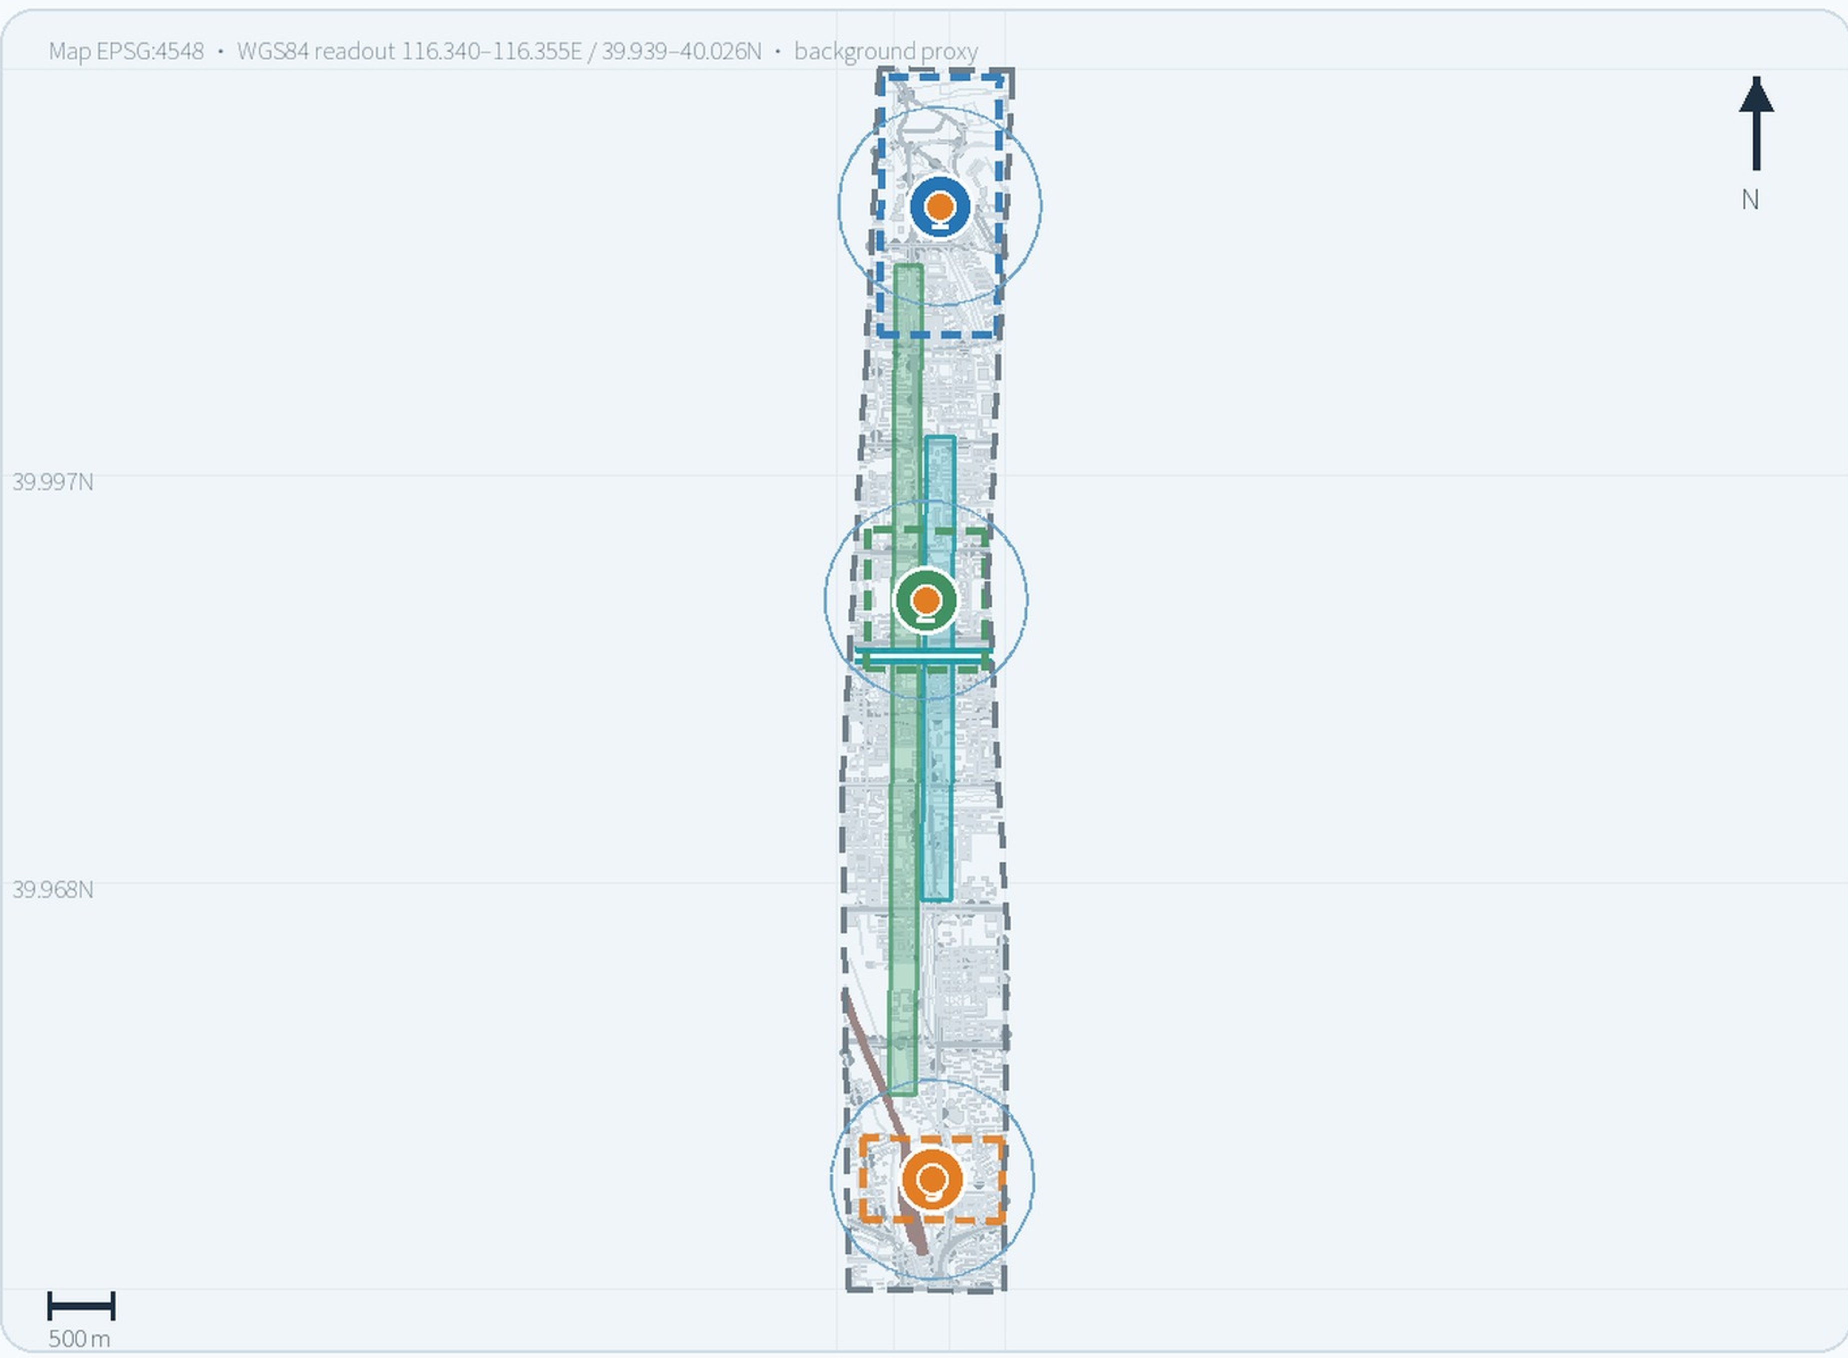
- OSM buildings / roads / rail context
- Key areas 1 / 2 / 3
- Conceptual civic spine
- Provisional boundary

Background: OpenStreetMap contributors / ODbL; provisional boundaries and design layers are not official redlines. Figures are explanatory; GeoJSON, metrics, and source records remain authoritative.

JING-ZHANG AI / PEOPLE-CITY | 04 / MOBILITY + BLUE-GREEN

Walking and blue-green screen: connect people before AI

The context network is an OSM research snapshot; bands are analytical parameters, not statutory catchments



116.340E 116.355E

One auditable network

Walking spine
Roads, paths, crossings, and station entrances must form a continuous, legible network with human assistance.

Blue-green interface
Green and public spaces are cooling, staying, and service nodes; ratios do not prove comfort.

Evidence gate
POI is unavailable and green/water is not downloaded; no existing-condition claim is generated.

Legend and status

- OSM roads / rail / buildings
- Blue-green / public-space interface
- Conceptual walking spine
- 800 m analysis band
- AI / observation candidate
- Provisional boundary

Background: OpenStreetMap contributors / ODbL; provisional boundaries and design layers are not official redlines. Figures are explanatory; GeoJSON, metrics, and source records remain authoritative.

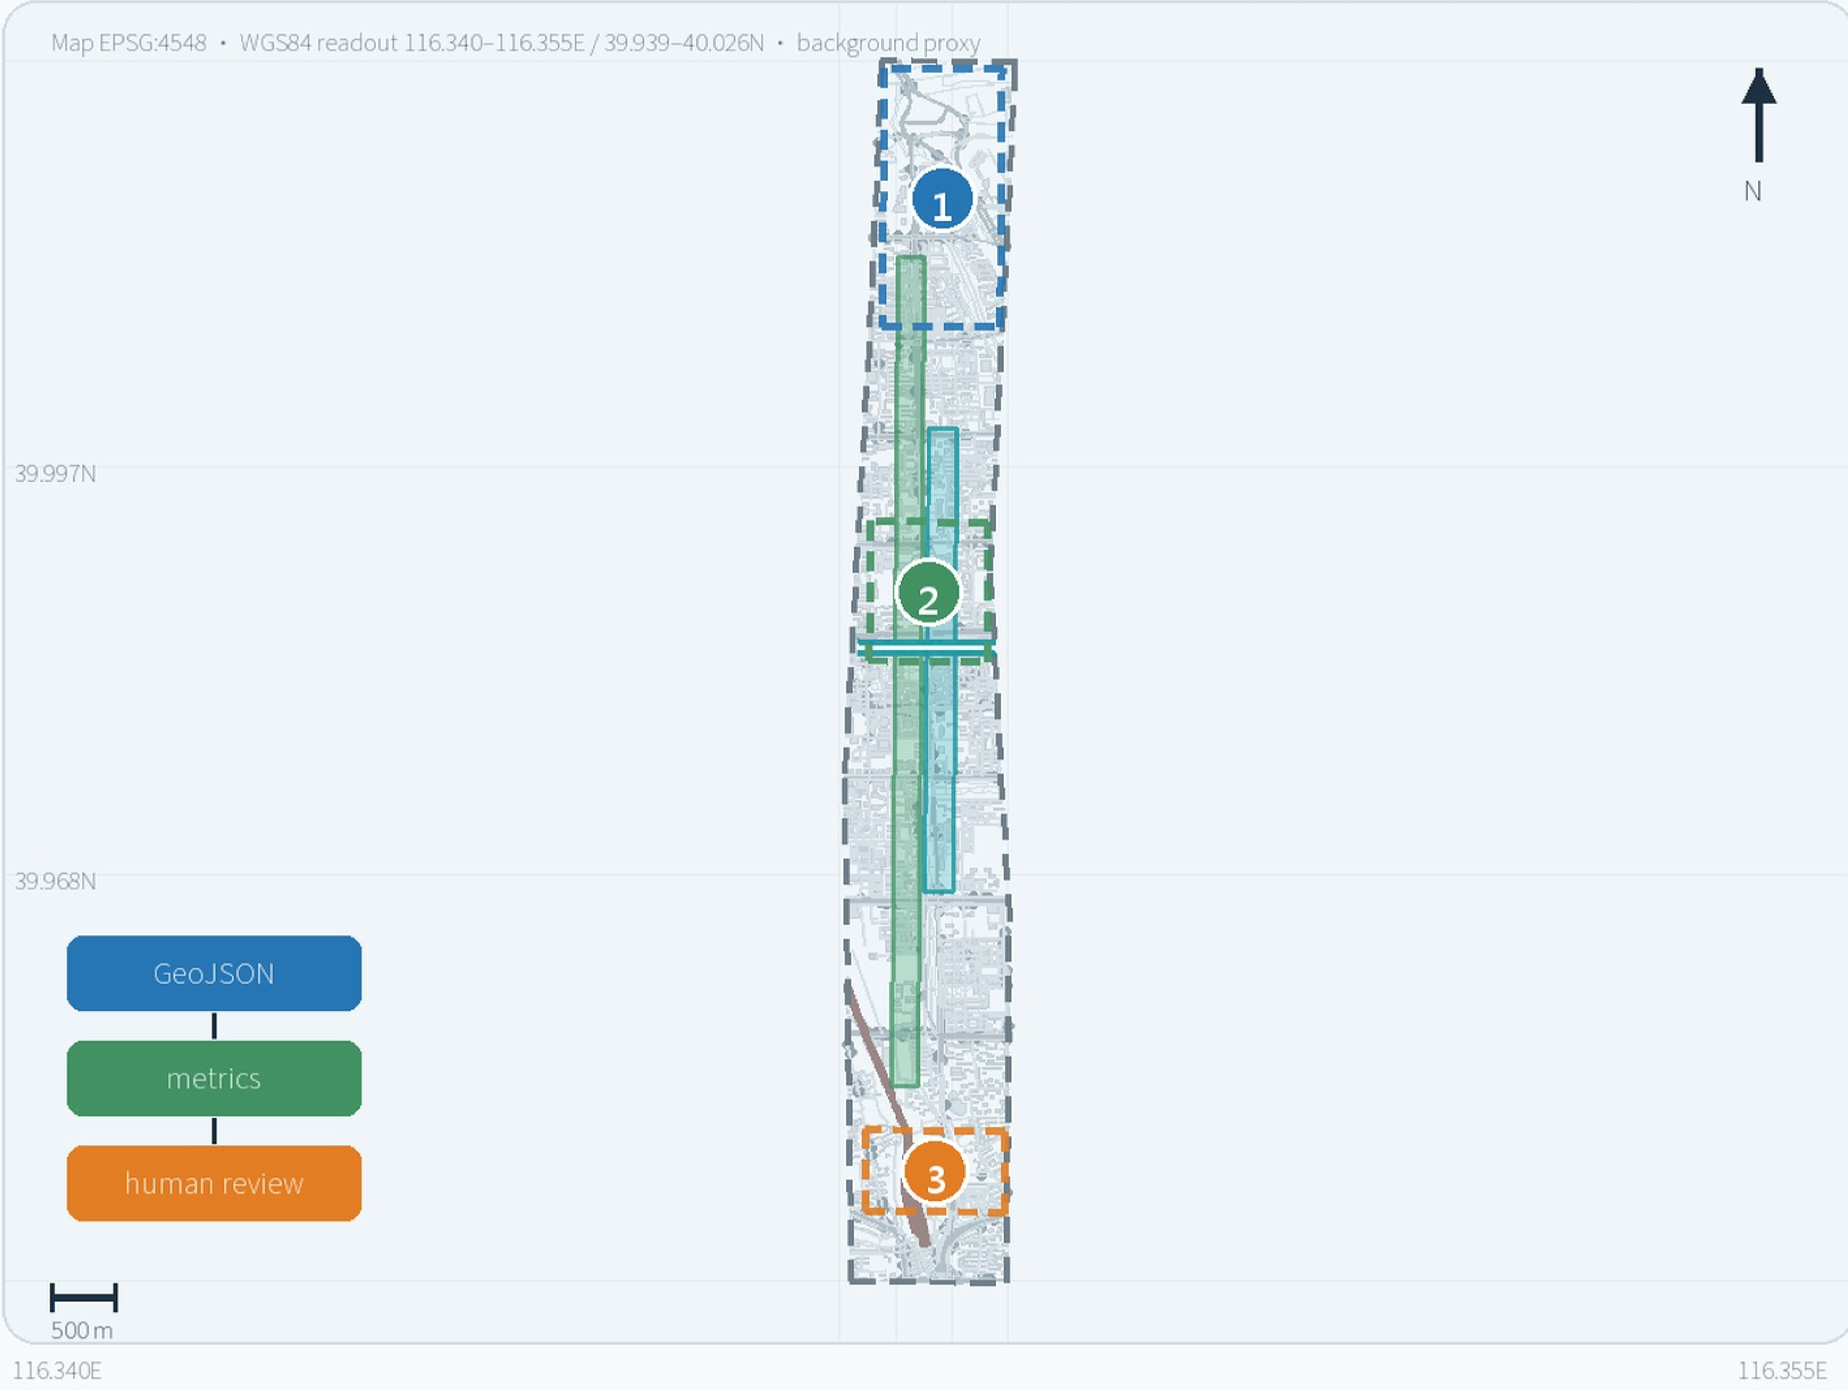
No false precision from proxy data: each AI scenario must first pass diversity, public-life, and low-car-access tests.

JING-ZHANG AI / PEOPLE-CITY

05 / METRICS + EVIDENCE

Metrics and evidence: make people-first design reversible and traceable

Known values come from submitted geometry; unknowns remain evidence requests, not estimates



Recomputable baseline

11.41 (K)
km² • study frame

0.31 (K)
km² • design footprint

12.3 (K)
% • green ratio

7.3 (K)
% • public-space ratio

3 (K)
areas • key areas

Evidence requests · U = unknown

Use mix • walking intersections • block length • active edges • public-life observation • accessible continuity • station coverage • route directness • frequent transit • shade coverage

K = known from submitted geometry U = unknown / evidence required

Background: OpenStreetMap contributors / ODbL; provisional boundaries and design layers are not official redlines. Figures are explanatory; GeoJSON, metrics, and source records remain authoritative.

Three people-first tests

JACOBS / DIVERSITY

Mixed uses, different times, and active ground floors must pass first; no trial without a use-and-time baseline.

GEHL / PUBLIC LIFE

Observe walking, staying, sitting, talking, and service use first; proxies cannot stand in for field observation.

NEWMAN / LOW-CAR ACCESS

Stations, walking, cycling, and transit come first; no continuous-spine claim without a verified network.
