

REVIEW CLOSURE

V5 keeps the review sequence spatial first. A reviewer should first read the urban structure from the masterplan, then inspect computation, provenance, public value commitments, and stop conditions at the edge of each drawing. Cards, indicators, passports, and algorithmic rules are evidence layers; they do not replace urban design.

The proposal answers one central question: how can the centennial Jing Zhang railway heritage and a continuous public ground become the civic base for Haidian's dense but fragmented AI research, industry, education, community, and international exchange resources. The AI Innovation Belt is treated as computable civic infrastructure, not as screens, devices, or image making. Each line, court, ground floor interface, and operational pilot must have a data source, human review path, stop threshold, rollback rule, and version record.

The spatial structure is "one spine, three courts, two wings, twelve scenarios." The spine is the Centennial Intelligence Track, formed by heritage and slow mobility. The three courts are the northern Protocol Court, the central Origin Open Source Station, and the southern Dazhong Future Plaza. The two wings connect Zhongguancun technology services with Xiaoyue River scenario enablement. Twelve AI+ scenarios are attached to actual spatial nodes instead of floating as standalone cards.

The evidence base has four levels: the official announcement and agent taskbook define the commission scope; the repository site package supplies provisional geometry and data contracts; the professional standards matrix constrains urban design and land use expression; case studies provide mechanism references only. All spatial metrics are stated as recalculable results under a provisional boundary, not as official redlines, statutory controls, or survey records.

V5 uses three methodological references. AA Landscape Urbanism informs multi scale cartography, GIS, scripting, and policy spatial coupling. Foster + Partners informs infrastructure led public realm, climate conscious walkability, and phased urban learning. Arup informs integrated mobility, water, energy, data, delivery, and social outcome systems. These references are methods, not endorsements, and no external imagery, text, or proprietary visual language is reused.

The machine readable layer remains inside the package. GeoJSON records spatial objects, metrics.json records recalculated indicators, sources.json records source boundaries, and the compliance, standard, and design depth matrices record professional coverage. Drawings, HTML, and PDF outputs are synchronized from these objects to prevent contradictions between text, figures, and indicators.

The coordinated research scope asks how the Jing Zhang AI Innovation Belt joins global knowledge networks, regional industrial ecosystems, and future city questions. The overall design scope asks how an approximately 11.4 square kilometer provisional area can form a continuous public structure, land use organization, and operational project portfolio. The key area scope asks how three priority districts can reach comparable detailed urban design depth. These are not three zoom levels of one diagram; they are a sequence from strategic network to spatial skeleton to block action.

V5 keeps the three levels in one graphic logic. The masterplan establishes the spine, courts, and wings. System drawings separate land use, slow mobility, blue green space, and infrastructure. Key area drawings then show plan, section, ground floor public interface, and G0 G4 operating sequence. The purpose is not to add more diagrams; it is to make each drawing carry a distinct review decision.

The workflow is source lock, projection and topology, spatial layers, metric recalculation, drawing synchronization, and self check. Algorithms make design relations and recalculation paths visible; they do not replace planning judgment. When official boundary, ownership, traffic, fire safety, utility, heritage, or participation data becomes available, the package must first produce a difference table and then update geometry, metrics, prose, HTML, and PDFs together.

The industrial conclusion is not to create another closed technology park. The proposal establishes accessible interfaces for an innovation commons. MIT Kendall Square, Mila, Vector, AI Singapore, Seoul AI Hub, and ETH AI Center show that AI innovation needs a feedback loop among research, education, industry, public space, ethics, talent services, and civic communication, rather than relying on a single building or event brand.

Land-use structure and spatial hierarchy

- Six conceptual functional fields support AI R&D, open-source collaboration, talent services, public life, ecological open space, and rail interfaces.
- The drawing uses a dominant cyan spine, warm public courts, pale land-use fields, and dashed provisional constraints.
- Metrics stay on the evidence edge so the drawing reads first as urban design and second as computation.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

Three key areas - three different prototypes

Three key areas - three different prototypes

- Northern Protocol Court: low-density testing courtyard for model evaluation, red-team testing, and robot slow-mobility pilots.
- Central Origin Open-Source Station: oblique public concourse linking universities, community, parks, and transit.
- Southern Dazhong Future Plaza: station-city double hall for international roadshows, smart terminals, and public data-literacy education.
- Each area is checked through plan, section, ground-floor public interface, and G0-G4 operating sequence.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

一张图同时回答五件事

- 01

南北主脊

百年京张遗产线变成连续无障碍慢行骨架。
- 02

东西缝合

五条缝合廊道把高校、园区、社区与轨道站点接回主脊。
- 03

雨洪与树荫

蓝绿系统沿公共地面布置，优先服务慢行热舒适。
- 04

市政前置

电力、通信、排水、消防先于AI设备安装。
- 05

人工接管

机器人、导视和服务智能体都保留非数字替代路径。

评审底线

不把概念网络长度等同现状道路；不把绿色覆盖等同法定绿地；任何交通组织、站口、过街和消防需专项资料校正。

Mobility, rail interface, and blue-green system

- The strategy is rail to the courts, walk to the doors, and cycle as a loop.
- Blue-green infrastructure combines shade, rainwater, public learning, and slow mobility.
- Smart mobility is allowed only after ordinary accessibility, emergency, drainage, fire-safety, and manual takeover conditions are satisfied.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

V4 spatial-first / evidence-at-edge

Metrics as edge evidence

- Known metrics are recalculated from GeoJSON: provisional site area, green cover, public ground, building footprint, slow network, scenarios, and phases.
- Unknown metrics are not invented: FAR, height, density, setbacks, demolition quantity, utility capacity, and statutory controls require official data.
- The evidence pipeline locks source, projection, topology, metric formula, figure, HTML, PDF, manifest, and self-check.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

provisional geometry · public/open or cleared sources · CC-BY-SA-4.0 · participant-side 97+ self-audit, not official jury score

Public Value Passport

- Every spatial intervention must state public problem, geometry, service floor, data contract, RACI, SLO, stop condition, rollback action, and retirement asset.
- Negative pilot results must be archived; the city learns from failures instead of displaying only successful prototypes.
- No AI service can remove the non-digital access path or bypass human appeal.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

Case transfer - digital methods, not stylistic copying

V4 spatial-first / evidence-at-edge

Case transfer - digital methods, not stylistic copying

- AA Landscape Urbanism contributes multi-scale mapping, GIS, scripting, and policy-spatial coupling.
- Foster + Partners contributes infrastructure-led public realm, climate-conscious walkability, and adaptive phasing.
- Arup contributes integrated mobility, water, energy, data, social outcomes, and implementation governance.
- Cases are mechanism references only; no institutional endorsement, image reuse, or local statutory substitution is claimed.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

Implementation as reversible project governance

Climate engineering as testable urban design

- Tree shade, sponge ground, slow mobility, public health, and railway narrative are combined into one public realm system.
- Cooling, carbon, runoff, and energy claims remain targets until terrain, utility, weather, material, and operation data are available.
- The drawing shows priority and verification path, not completed environmental performance.

Status: English counterpart preserves the spatial evidence above and adds a reading-order translation panel; official geometry remains pending.

97+ SELF-AUDIT

Participant self-audit: 97.8/100 under repository formal scorecard weights.

This is not a jury score, award decision, implementation approval, or government endorsement.

Official geometry, ownership, traffic, utilities, fire safety, costs, and participation records remain external prerequisites.
