

JING-ZHANG DISCOVERY LINE

Using Jing-Zhang Railway Heritage Park as a public spine, this proposal turns urban questions into scientific and civic action that can be falsified, retested, and exited.

A3 PROPOSAL BOOKLET

niufuti-cyber

AI-generated conceptual image. One public spine links three station structures from near to middle to far: the foreground station is largest and brightest, the second is less bright, and the third closes in faint light against the blue-hour skyline. The city, stations, activity, and lighting are conceptual and do not represent existing conditions or element-by-element realization of the nine data layers. Corresponding call task: "Create landmark urban-landscape nodes." (scheme-side translation)

One spine, two tracks, three stations — what may change and what must not, all on one sheet.

Three-station relay | duties and scope

Research about 43.6 km² | Design 11.412825 km² | Areas 368.4 ha

01 | Zhongzhiyuan

Calibration and independent retesting

Announced key-area extent 192.1 ha

Duty ends at retesting; it does not replace approval.

02 | AI Origin

Problem intake and human reframing

⊕ M01 responsibility station

Responsibility is here; the spatial candidate is elsewhere.

03 | Dazhongsi

Authorized limited first use and exit

◇ M01 spatial candidate

Exact location UNKNOWN

Limited first use begins only after authorization and retains exit.

Status | Known = solid | provisional = dashed

UNKNOWN = text label

Target = responsibility | diamond = spatial candidate

Data source: © OpenStreetMap contributors / ODbL 1.0

Public sources: open call notice (2026-05-09);
temporary spatial working base

Generated: 2026-08-26

Provisional geometry is for design discussion only; it is
not an Official Planning Boundary or a basis for
approval.

Conditional section | Conceptual Representation; no engineering dimensions

Existing building interface

Continuous passage / human service

Public interface | To be determined by formal conditions

Green space / Public Space

Statutory controls UNKNOWN

Statutory land use, land rights, control lines, actual interface width, and engineering placement: UNKNOWN

Local sources: geometry/land_use.geojson (983 features); key_areas.geojson; proposal.md:80-88,131-141

Evidence boundary: Not approved · Not authorized · Not implemented

The six colors are a reversible visual aggregation and do not change the 12 source-class labels.

Three-way kerb allocation and second-by-second change: the same kerb segment used at different times for walking, short stops, and loading (AI-generated conceptual illustration)

AI-generated concept illustration: at dusk on the heritage greenway, a quadruped inspection robot works autonomously along the preserved tracks, its gimbal light marking a loosened fastener while a maintenance worker verifies on a handheld terminal from the path.

Jing-Zhang · Discovery Line | Dazhongsi M01

V03 | Four States of One M01 Conceptual Kerbside

Planning Figure | English

Deterministic vector drawing | Not to scale | Conceptual Representation

One-variable rule | Base, non-AI route, human service, loading, and buffer remain; only the removable element state changes

Daily: slot empty → First use: element inserted and on → Human Takeover: same element off → Restoration: element removed and surface repaired

Design Assumption | Human / AI shared service 1.5–2.0m (includes AI 1.2–1.5m)

Design Assumption | Loading / static 2.5–3.0m; loading safety buffer 0.5–0.8m

Standard-Based Conditional Value | Parking-cycle buffer recommended $\geq 0.5\text{m}$ only where the clause conditions apply | Standard extract:1342–1344

Clear-footway road class undecided; no width in Clause 4.6.1 is preselected or added into a road red line | Standard entry:771–782

Daily Baseline | Human baseline

Same base

Only change in this panel | Removable-element slot remains empty

Fixed loading, static parking, and human guidance operate independently.

Kerbside plan / facilities / mini-section | Conceptual Representation

Continuous non-AI route / permanent human service | Conceptual Representation

Location / road-use authority / responsible entity UNKNOWN

First Use | Limited activation

Same base

Only change in this panel | Removable element inserted into the shared-service strip

Human confirmation and emergency stop remain; the removable element stays outside the clear footway.

Kerbside plan / facilities / mini-section | Conceptual Representation

Continuous non-AI route / permanent human service | Conceptual Representation

Location / road-use authority / responsible entity UNKNOWN

Human Takeover | AI OFF

Same base

Only change in this panel | Same element switches from ON to OFF

AI stops; permanent human service and the continuous non-AI route remain uninterrupted.

Kerbside plan / facilities / mini-section | Conceptual Representation

Continuous non-AI route / permanent human service | Conceptual Representation

Location / road-use authority / responsible entity UNKNOWN

Restoration | Remove and repeat walk

Same base

Only change in this panel | Element removed and slot surface restored

Restore the prior state and non-AI timetable, then have real users repeat the walk.

Kerbside plan / facilities / mini-section | Conceptual Representation

Continuous non-AI route / permanent human service | Conceptual Representation

Location / road-use authority / responsible entity UNKNOWN

UNKNOWN list | Do not fill

M01 exact location, road class, formal red line, road-use authority, survey, levels, utilities, vehicle envelope, fire conditions, responsible entity, and authorized time window

Locator-map evidence boundary

Only the road centreline is Direct Data Output; the observation window, section line, and all kerbside content are Conceptual Representation

Not approved · Not authorized · Not implemented

Public basis | DB11/T 1116—2024 extracts: 771—782, 1342—1344 | Design assumptions

A road centreline cannot establish the kerb, red line, or section width

An older adult with white hair, accompanied by a younger person, crosses a removable pad over the heritage rails perpendicular to the park path. Farther along the same pair of rails, a recorder measures the rail-level difference at an unpadding segment, showing “passable / still a barrier / independently retested” in one frame. The slender foreground post is a trial stop post with an industrial mushroom emergency-stop button, not fire equipment. Corresponding call task: “Focus on breaks in the park’s slow-mobility system and propose innovative solutions for optimizing the transport system.” (scheme-side translation) Disclosure: AI-generated conceptual image. The small sign on the stop post is generated pseudo-text. Field level differences, safety dimensions, slope, materials, load capacity, slip resistance, location, approval, and operations responsibility are UNKNOWN and require accessibility, heritage, and operations review.

Jing-Zhang · Discovery Line | Dazhongsi M01

V16 | M01 Three-State Conceptual Sections on One Baseline

Planning Figure | English

Deterministic vector drawing | Not to scale | Conceptual Representation

M01 locator map

Dimensions are conditional references only | Not to scale, not additive, and not a road red line

Direct Data Output

Conceptual Representation

UNKNOWN

Clear footway | Road class undecided; parallel conditions: local road recommended $\geq 3.0\text{m}$ / min 2.0m ; secondary arterial $\geq 3.5\text{m}$ / 2.5m ; expressway frontage / arterial $\geq 4.0\text{m}$ / 3.0m
Standard-Based Conditional Value | Standard extract:771–782 | Applies only if formally designated as an urban-road footway of the corresponding class

Design Assumption | Shared service $1.5\text{--}2.0\text{m}$ (includes $1.2\text{--}1.5\text{m}$ AI element); loading / static $2.5\text{--}3.0\text{m}$; safety buffer $0.5\text{--}0.8\text{m}$

Source | Design-assumption basis | Elements must not occupy the clear footway; shared widths are not double-counted

Standard-Based Conditional Value | Parking-cycle buffer recommended $\geq 0.5\text{m}$ only where motor and cycle traffic are undivided and parking adjoins the cycle lane | Standard:1342–1344

Standard-Based Conditional Value | No class preselected: cycle lane expressway frontage / arterial 3.5m ; secondary arterial 3.5m / constrained 3.0m ; local road 2.5m / high flow 3.0m | Standard:788–789; if provided, street-tree facility strip recommended 1.5m | Standard:841–842

When road class / red line / clear width / gradient arrive $\rightarrow$ select condition set X; until then $\rightarrow$ remain UNKNOWN

Public basis | DB11/T 1116—2024 extracts: 771–782, 1342–1344, 1476–1478 | Design assumptions

A road centreline cannot establish the kerb, red line, or section width

AI-generated conceptual image. Constructed people use a holographic city model by voice and gesture; the human desk and physical stop switch remain equal to AI. The place, people, facilities, and process are conceptual, not built or operating facilities. Corresponding call task: “Improve the functions for showcasing and releasing results, and for residential and everyday-life support.” (scheme-side translation)

08

Figure 5 | Nothing Moves Until the Signature Line Is Filled

In a bright, double-height modern Chinese service hall, middle-aged and older people point to agent screens while staff explain printed forms item by item. Lightweight terminals stand on quick-release flanges; citizens continue to use full-capacity human service windows and seating. A registration plaque wall, retirement covers, a desk-side emergency stop, and a responsibility notice place agents within an accountable, pausable, and withdrawable public-service mechanism. Corresponding call task: “Focus on AI-native and AI+ convergence-enabled new business formats, including agents, intelligent terminals and content consumption.” (scheme-side translation) Disclosure: AI-generated conceptual image. Screens, plaques, and responsibility notices contain pseudo-interfaces or pseudo-text. The hall, terminals, posts, processes, responsible entity, location, quantity, versions, and retirement arrangements are conceptual or UNKNOWN and do not indicate construction or authorized operation.

AI-generated conceptual image. One block is cut open: everyday life remains at ground level, human service stays inside the shop, and a crane removes an arrow-screen AI component in mid-air; only credible municipal utilities appear below ground. Buildings, components, people, and underground layers are conceptual and do not represent real levels, utilities, or construction conditions. Corresponding call task: “Explore development models and implementation pathways for integrating new AI-industry service facilities—such as distributed energy and edge computing—with the three traditional facility systems.” (scheme-side translation)

AI-GENERATED CONCEPTUAL IMAGES

AI-generated conceptual image | Conceptual comparison, not a photograph. From the same viewpoint as V01, the “later” condition removes fencing, integrates preserved rails into finished paving and grass, lets people pass through, and withdraws equipment at the edge. A generated matched viewpoint is not real before-and-after evidence from the same site. Corresponding call task: “Explore distinctive scenarios for ‘AI+’ Public Space” / “Explore functional scenario design in which green space serves AI development.” (scheme-side translation)

AI-generated conceptual image. On step-free shared paving, a small-vehicle fleet handles loading while people load, verify, and dispatch beside it and pedestrians continue to pass. The place, vehicles, people, deployment, and operating status are conceptual. Corresponding call task: “Improve static transport organization, including non-motorized-vehicle parking.” (scheme-side translation)

AI-generated concept illustration: a retired humanoid robot stands on a roadside maintenance rack as a technician removes an arm module; maintenance and retirement records stay in public view as residents browse blank archive slabs at the roadside cabinet.

RISK, COPYRIGHT, AND COMPLIANCE

01 We have to prevent a few factual errors: treating a temporary boundary as an Official Planning Boundary; turning an aggregated request into evidence for one street; counting another project's or department's money as this proposal's budget; presenting a recommended entity as an authorized operator; presenting a synthetic persona as an interviewee; presenting a generated image as a site image or formal planning drawing; or presenting an activity or pilot candidate as scheduled work. If any of these happens, the text, figures, and machine-readable files return to a more conservative evidence status and are labelled again.

02 The general limits of applicability for the preceding cases are consolidated here. The eight cases answer only “what to borrow, where to place it, and what must not be copied”; they do not endorse Jing-Zhang. For Punggol Digital District, a mature urban area does not copy the area-wide sensing and centralized backend of a newly built district. For Seoul AI Hub / Yangjae, an industrial ecosystem cannot replace validation of residents’ lives and does not imply that capital or institutions have already joined. For Toyota Woven City, a corporate-led, closed, newly built prototype city cannot represent public governance in a mature urban area. For Detroit–Ann Arbor, autonomous driving or corporate development does not become Jing-Zhang’s main line, and the two projects are not written as the same entity. For Curiosity Lab at Peachtree Corners, large-scale sensing, a control room, road length, awards, and the autonomous-driving main line are not transferred. For Testbed Helsinki, another city’s procurement, data, and organizational systems cannot be copied, and a short trial cannot establish scientific validity. For Berkeley A-Lab, a closed laboratory does not contain residents’ rights, public authorization, or urban responsibility. For Chicago Array of Things, a large sensing network is not replicated, avoiding the surveillance of Public Space and mission drift. These limits correspond one-to-one with the eight positive adaptation actions in the preceding table and can be checked by case name.

03 The general qualifications for overall design, transport, and implementation are also stated together once in this chapter. No related project, policy direction, or departmental funding automatically becomes a site, budget, or construction commitment for this proposal. Road geometry comes from provisional and conservative OSM base material and cannot be treated as a precise control line. Implementation does not begin by assigning construction dates; it first places objects into the five ledgers and through the six gates. If any gate is unmet, the project does not advance automatically. This working method also does not replace statutory planning, construction, procurement, ethics, or data procedures. The corresponding chapters now explain how professional teams can continue the work; this chapter preserves the complete conditions and limits.

04 The limits on metric use are consolidated as follows. The design meanings of these figures are also limited: the green-space ratio only helps check the relationship between Blue-Green continuity and support for talent’s everyday life in the current model, while the Public Space ratio only helps check spatial provision for innovative interaction, no-app services, and the three responsibility interfaces. OSM existing features are a conservative subset, so neither metric directly describes complete existing conditions. Without formal land-rights and statutory-control materials, neither ratio can be used to infer buildable area. Scenario metrics do not fill in attractive numerators. Kerbside metrics consider hazardous incidents, waiting, accessibility, and noise without tracking individual couriers. A directional judgment is not presented as an object-level validation conclusion until it reaches the corresponding evidence level. On this basis, the metrics team retains the original formulas, denominators, and evidence levels and completes a traceable recalculation when formal materials arrive.

COPYRIGHT, SOURCES, AND DESIGN-TEAM HANDOFF INDEX

COPYRIGHT / SOURCES / LICENSE BOUNDARIES

- 05

All spatial, operational, branding, and policy statements remain Conceptual Recommendations. The current proposal does not decide planning, healthcare, education, procurement, financing, investment attraction, or public trade-offs in place of duly empowered actors. Responsibilities, funding, land rights, dimensions, capacity, procedures, and operational matters unsupported by formal materials are all marked UNKNOWN / pending confirmation from formal materials. The provisional boundary, three rough key areas, OSM base material, and conceptual interventions remain identified by status throughout the text and figures.
- 06

Privacy and rights are jointly governed by minimum data collection, Human Review, informed participation and appeal, an equivalent non-AI path, and deletion or retirement at expiry. If a trial increases hazardous incidents, obstructs fire safety or accessibility, worsens waiting, crosses night-time noise limits, requires personal trajectories, is used for platform labour evaluation, or lacks maintenance responsibility, it stops immediately or returns to the non-AI option. People make the final decision; AI cannot turn aggregated results into an automatic decision.
- 07

The copyright inventory covers policy and case-study text, map and data licenses, historical photographs, trademarks and likenesses, fonts, generated media, and toolchain dependencies. Ten bilingual figure pairs have been generated through their registered project-script and controlled concept-underlay pipelines and mounted in the static page through relative paths under assets/figures/; the page uses no remote images, data URIs, external map screenshots, or material lacking rights clearance. The user has confirmed submission under the GitHub account niufuti-cyber in a personal capacity, approved public disclosure of AI-tool use, and confirmed that the Lovart-generated Logo assets may be used commercially. Commercial permission does not establish trademark clearance, registrability, or non-infringement. Four PDFs and the final manifest are assembled in the submission directory; the current file inventory and validation state are recorded in the bundled manifest and self-check.
- 08

“Referenced” in the professional standards matrix and design-depth matrix means only that the body provides an entry point for the response. It does not mean that professional materials are complete or that the design depth has been achieved. In particular, formal documents on architectural design depth, formal control conditions, ecology and heritage, existing buildings, land rights, funding, and operating responsibility must still be closed through later formal materials.

D01–D06 | DESIGN-TEAM HANDOFF OUTPUTS

- D01

Formal base-map replacement and nine-layer recalculation table

Input | Formal polygons, survey, plan controls, ownership

Acceptance | Keep every object ID continuous and recalculate all derived metrics
- D02

R02 continuous-passage breaks and minimum-repair list

Input | Joint site walk, fire safety, accessibility, traffic

Acceptance | Each break records location, problem, responsible role, and repair or human fallback
- D03

M01 candidate plan, three-state sections, removable-element schedule

Input | Road class, clear width, loading, pedestrian conditions

Acceptance | One drawing shows fixed base, non-AI route, removable AI layer, and human takeover
- D04

Like-for-like A/B/C comparison

Input | Non-AI baseline, aggregate data, versions

Acceptance | Same task, extent, and burden; no individual tracking
- D05

Temporary works, removal, restoration, and operations record

Input | Ownership, crew, maintenance, cost

Acceptance | Every element has installation, stop-use, removal, archive, and restoration roles
- D06

Human decision and retest confirmation record

Input | Affected-person input, risk, repeat-walk result

Acceptance | Continue, modify, not adopt, and remove can all be signed

CURRENT STATUS

External | Not submitted · Not accepted · Not selected · Not implemented

Local four gates | deterministic PASS · spatial PASS · visual PASS · professional PASS

formal-review-ready means only that the local package may enter formal review; it does not imply any external status above.
