

Read the Corridor Before Designing It

Context, users, fractures and the four-action concept

01 Context and the Centennial Jing-Zhang Corridor

The corridor is read as a nine-kilometre public-space spine linking railway heritage, daily life and innovation resources.

02 Three Voices: Heritage Ecology, Community Life, Campus Innovation

Space and time are tightly interwoven, but cross-boundary interaction remains weak.

03 Users and Everyday Rhythms

Different users meet the corridor at different times; design must first understand their ordinary rhythms.

04 Three Urban Fractures

The main issues are a broken slow-mobility corridor, closed interfaces and a weak connection to the waterfront.

05 Four Spatial Actions

Preserve, insert, share and calibrate: each new action must answer a verified existing relationship.

06A Concept Origin: Harmony and Resonance

Harmony is not uniformity; resonance is not self-performance.

Key Areas, Conditional AI and Operations

Three focus areas, four entry gates and evidence-based phasing

12 Six Segment Characters and Typical Sections
Six segments form one corridor but do not share one uniform spatial character.

13 Key Area 1: Dazhongsi
Protect the heritage district while opening the first floor and street frontage as one public place.

14 Key Area 2: AI Origin
Innovation is not a separate island, it opens interfaces within campus and community life.

15 Key Area 3: Zhongzhi Park
The Qing River, Xuexiyuan Station and park service forecourt become one continuous public-space sequence.

16 Controlled AI Scenarios: Four Entry Gates
An AI scenario may enter only after passing location, time, boundary and exit gates.

17 Implementation and Operations
Implementation first repairs public relationships, then advances focus areas conditionally, and only then sustains operations.
