

NO GENERIC SOLUTION FOR JING-ZHANG

Three Site-Specific Spatial Rules for the AI Era

CORE PROPOSITION

Jing-Zhang does not need one all-purpose centre repeated three times. It needs a method that detects equivalent spatial consequences and changes spatial and project choices through site evidence.

DIFFERENT NAMES CAN SHARE ONE CONSEQUENCE

ONE CORRIDOR DOES NOT REQUIRE ONE FORM

AI GENERATION DOES NOT REPLACE PROFESSIONAL JUDGEMENT

30-SECOND SUMMARY

AI can generate many proposals quickly, but it can also reproduce the same centre, consolidated superblock and landmark complex across very different places. This proposal does not treat frequency as planning consensus. It preserves the real differences among Jing-Zhang's three key areas through three non-interchangeable spatial rules: ordinary shared functions at Zhongzhiyuan are not reconcentrated in a single new centre; renewal at AI Origin must not reduce independent entrances, short street links, courtyard connections or small independently usable units; and at Dazhongsì, public demands are consolidated across projects and time before the scale, section and delivery sequence of the shared public ground are set. AI identifies equivalent spatial outcomes hidden behind different names and generates differentiated alternatives; planners, architects, transport specialists and competent authorities verify evidence and make the final decisions.

EIGHT-PAGE READING PATH | EACH PAGE ADDS ONE NEW JUDGEMENT

02 PROBLEM

Detect equivalent consequences behind different names

03 STRUCTURE

Establish the shared connection and three design extents

04 ZHONGZHIYUAN

Decide whether ordinary shared functions should recentre

05 AI ORIGIN

Test whether renewal damages fine-grain urban fabric

06 DAZHONGSI

Use time-based demand to shape the public ground

07 USE

Test usability with six groups and twelve scenarios

08 DELIVERY

Embed the rules in guidance, briefs and review schedules

From batch generation back to real spatial consequences

SIX NAMES, FOUR RECURRING SPATIAL CONSEQUENCES

WHAT REPEATS IS THE SPATIAL CONSEQUENCE

- 01 ORDINARY SHARED FUNCTIONS RECENTRE
- 02 ENTRIES, SHORT LINKS AND COURTS ARE CONSOLIDATED
- 03 COMMERCIAL LANDMARK PRECEDES PUBLIC SPACE
- 04 PROJECTS CLAIM THE SAME PUBLIC IMPROVEMENT

AI-ASSISTED SPATIAL APPRAISAL

HOW THE PUBLIC REPOSITORY ENTERS THE PLANNING ARGUMENT

BOUNDARY OF AI SUPPORT

Consolidate public information, detect equivalent consequences and generate distinct options; do not replace regulatory, engineering or delivery decisions.

PROFESSIONAL PLANNING RESPONSIBILITY

Verify site conditions, spatial objects, public value and delivery relationships; explain the selected option and rejected alternatives.

One public connection, three non-interchangeable modes of renewal

PLANNING JUDGEMENT

The Jing-Zhang heritage park, rail and bus access, cross streets, continuous walking, blue-green space and basic public services form a shared connection. This connection does not require the three areas to adopt the same centre or landmark; the three spatial rules respectively govern the distribution of shared functions, retention of fine-grain streets and courtyards, and joint delivery of the public ground.

THREE DIFFERENT PLANNING QUESTIONS

ZHONGZHIYUAN

03

Can existing or planned premises carry ordinary shared functions?

Verify occupancy, adaptability and specialised physical requirements first.

AI ORIGIN

02

Will renewal reduce entrances, short links, courtyards or small usable units?

Verify structure, fire safety, use, entrances and courtyard relations first.

DAZHONGSI

01

How should multi-project, time-based demand jointly shape the public ground?

Verify time-based demand, works responsibility and acceptance extent first.

01

Jing-Zhang heritage public connection

02

Rail and bus access

03

Cross-city streets

04

Continuous walking and cycling

05

Blue-green space

06

Three key areas

Distribute ordinary shared functions across several premises; allow specialised new space only where physical requirements justify it

DISTRIBUTED SHARED-PREMISES NETWORK

CONCEPT SCENE | NOT A REAL SITE IMAGE

SPATIAL RULE

Meeting, exchange, everyday services and general incubation must not be reconcentrated in a single comprehensive centre; they should first be distributed among existing, under-construction or adaptable premises. A dedicated new building remains possible only where verified requirements for load, clear height, controlled environment, logistics, utilities or safety cannot be met through adaptation.

SPATIAL ELEMENTS

- 01 Existing or under-construction premises
- 02 Open ground floor
- 03 Distributed shared node
- 04 Open courtyard
- 05 Walking and transit connection
- 06 Specialised R&D and validation space (pending verification)

SPATIAL SECTION

VERIFY BEFORE DETAIL DESIGN

Verify occupancy, adaptability, time-sharing capacity and specialised physical requirements.

Renewal must not reduce independent entrances, short links, courtyards or small independently usable units

SPATIAL RULE

Renewal must not reduce independent entrances, short street links, courtyard connections or small independently usable units. Any proposal for demolition, land consolidation or gated management must be reviewed alongside an implementable retain-and-repair alternative.

SPATIAL ELEMENTS

- 01 Retained building
- 02 Independent entrance
- 03 Short street link
- 04 Shared courtyard
- 05 Open ground floor
- 06 Small independently usable unit / adaptive-reuse candidate (pink)

SPATIAL SECTION

VERIFY BEFORE DETAIL DESIGN

Verify structure, fire safety, site protection, entrances, use and retain-and-repair feasibility.

Commuting, events, deliveries, night-time use and construction jointly set scale, section and sequence

THREE DEMAND LAYERS

- 01 Four-direction walking and accessibility
- 02 Cycle organisation
- 03 Station forecourt space
- 04 Public-service interface
- 05 Delivery and construction periods
- 06 Separate works package and acceptance extent

TIME-BASED DEMAND MATRIX | 0 NONE, 1 LOW, 2 MEDIUM, 3 HIGH; CONCEPTUAL, NOT MEASURED; SURVEY CALIBRATION PENDING

	AM PEAK	DAYTIME	PM PEAK	NIGHT EVENT	WORKS WINDOW
COMMUTE + TRANSFER	3	2	3	1	
WALKING + ACCESS	3	2	3	2	1
CYCLING	3	2	3	2	1
EVENT + NIGHT USE		1	1	3	
DELIVERY + MAINTENANCE		1		2	3
CONSTRUCTION					3

SCALE: DERIVED FROM OVERLAPPING PEAKS AND TIME-SHARING CAPACITY

SECTION: ACCOMMODATES MOVEMENT, STAY, CYCLING AND SERVICE

SEQUENCE: PUBLIC WORKS KEEP THEIR OWN PACKAGE, PROGRAMME AND ACCEPTANCE

Spatial interfaces from research to adoption, alongside everyday public life

SIX USER GROUPS TEST WHETHER THE SPACE IS ACTUALLY USABLE

P01  Planning and project review officer A clear comparison of site evidence, alternatives, spatial consequences, responsible parties and matters requiring further verification.	P02  Existing-premises and public-space operator Clear public boundaries, operating hours, service interfaces, maintenance responsibility and safety requirements.	P03  Researcher, startup team and enterprise user Legible transitions among existing small units, shared facilities, confidential space and professional services.	P04  Industry-validation and safety specialist Clear boundaries for controlled access, isolatable testing, equipment logistics, safety, shutdown and feedback.	P05  Resident, commuter and everyday service user Open routes, accessibility, cycling, shaded places to stay and public services are not displaced by display, testing, deliveries or commercial activity.	P06  First-time visitor and international exchange participant Multilingual wayfinding, continuous and legible routes, staffed public interfaces and essential information that does not depend on a phone.

TWELVE USE SCENARIOS | FROM PLANNING REVIEW TO DAILY OPERATION

01 New-space necessity review Zhongzhiyuan Share or adapt ordinary functions; reserve new construction for verified specialised needs.	02 Retain-and-repair option review AI Origin Retain entries, links, courts and small units unless repair is infeasible.	03 District public-ground coordination Dazhongsi Create one station-area public ground with a separate works package and independent acceptance.	04 Everyday sharing across premises Zhongzhiyuan Link open ground floors and shared service points as a walkable network.
05 Specialised physical-condition validation Zhongzhiyuan Keep isolatable and reversible validation space outside everyday circulation.	06 Small-batch engineering validation Zhongzhiyuan and specialist-service interfaces Provide a complete equipment-access, isolated-operation and return-to-use sequence.	07 Urban-application integration validation Approved urban-application settings and Dazhongsi public-service interfaces Keep testing outside basic public services and retain an ordinary non-digital route.	08 Adaptive-reuse matching AI Origin Use open ground floors, retained entries, shared courts and small infill.
09 Everyday street-and-courtyard operation AI Origin Keep varied courtyard uses without closing short links.	10 Accessible interchange and route explanation Dazhongsi Attach digital explanation to continuous walking, accessibility and cycling.	11 Public learning along the Jing-Zhang Railway Jing-Zhang public-connection corridor and three public identity nodes Put history along walking routes and places to stay, not in a separate pavilion.	12 Annual project and spatial review Jing-Zhang AI Innovation Belt Update the three rules with verified evidence and revise scale and sequence.

USER NEED → SCENARIO TASK → SPATIAL INTERFACE → OPERATING FEEDBACK

THREE INDUSTRY-VALIDATION SCENARIOS

Specialised physical-condition validation • Small-batch engineering validation • Urban-application integration validation

Complete the evidence first, then embed the three rules in project briefs and urban-design guidance

FIVE IMPLEMENTATION TOOLS

01	Key-area urban-design guidance clauses	02	Renewal project briefs	03	Spatial option appraisal schedule	04	Dazhongsi time-based demand and responsibility schedule	05	Annual spatial and operational review
Embed each spatial rule in the relevant area's spatial controls and detailed verification		Specify the site evidence, alternatives, spatial objects and professional responsibilities required from each project		Record the spatial consequences of new build versus sharing, consolidation versus repair, and single-project works versus the shared public ground		Record projects, periods, demand, public-improvement IDs, responsibility shares, works packages and acceptance status in one schedule		Revise spatial options, project scale, responsibility and sequence using new evidence and operational feedback	

RESPONSIBILITY

01	AI SUPPORT	Evidence consolidation, requirement matching, spatial-consequence identification and alternative generation
02	PLANNING + DESIGN	Verify conditions, regulation, spatial options and delivery conditions
03	TRANSPORT / UTILITIES / SAFETY	Verify sections, capacity, operations, safety and engineering feasibility
04	COMPETENT AUTHORITIES	Make lawful decisions on construction, demolition, approval, delivery and acceptance

PROVISIONAL DESIGN-MODEL VALUES (NOT STATUTORY CONTROLS)

SITE AREA	GREEN RATIO	PUBLIC-SPACE RATIO
≈11.4 km²	≈6.7%	≈5.1%
SITE AREA = PROVISIONAL EXTENT AREA		
GREEN RATIO = PROVISIONAL GREEN AREA / SITE AREA		
PUBLIC RATIO = PROVISIONAL PUBLIC AREA / SITE AREA		

CURRENT EVIDENCE GAPS

- 01Official boundaries, controls, heritage and ownership
- 02Building structure, fire, use and adaptability
- 03Observed mobility, accessibility, cycling and public services
- 04Road sections, utility capacity and construction conditions

UPDATE WHEN FORMAL DATA ARRIVE

Once formal extents or authorised data are obtained, the provisional extent, design layers, areas, ratios, drawings, web pages and figures in the text must all be updated together.

The current extent is a non-official provisional concept and all drawings and metrics can be updated when formal data arrive; it is not an official redline, survey, statutory land use, ownership record, precise siting, road or utility engineering proposal.
